

REPEG CLUB PRESENTS

WHITEPAPER

v1.0 - Wheel of Repeg · Weekly Round · Create Your Own Luck

Win the **right** to repeg your own USTC 1:1 for USDC — funded entirely by ticket sales, decided by public blockchain data, and checkable by anyone in their own browser.

Chain: Terra Classic (CosmWasm) Live at: repegclub.com

■ Live on mainnet

01 The idea

USTC trades today at a small fraction of a dollar, and nothing about that changes just because a token pair says otherwise. Repeg Club doesn't promise to move that market price for everyone — nobody can, honestly, without a treasury large enough to buy the entire float, and no such treasury exists here.

What it does instead is smaller, real, and repeatable: players pool USDC by buying tickets to a round. When that round draws, the winner doesn't receive cash — they receive the **right to redeem their own USTC for USDC, 1:1**, up to that round's prize. The USDC for that redemption isn't borrowed from anywhere else; it's exactly what the other players paid for their tickets. It's a personal repeg, funded by the community that wanted one, one round at a time.

No outside treasury backs the prize. No admin sets the outcome. The chain does the drawing, and anyone — not just the winner — can redo the math and check it.

Why this, really

The 2022 depeg wasn't just a market event for the people who lived through it — it was a real loss, and for a lot of people it left a wound that's stayed open since. Repeg Club can't undo that. What it can do is give someone a real, public, on-chain moment: their own USTC, redeemed 1:1, verifiable, and impossible for anyone to take back or argue away. That moment is worth something on its own, separate from how much money is actually involved. That's the part of this project that isn't really about economics.

02 How Wheel of Repeg works

A round moves through five stages. Every step can be triggered by any wallet — in practice an automated keeper bot usually does it within seconds, but nothing about the game depends on Repeg Club's own infrastructure staying online.

1 Open Anyone buys tickets. More tickets, better odds — but every ticket, even a single one, has a real shot.	2 Close Once a minimum headcount is reached, every new ticket resets a short countdown — like a live auction, so nobody's shut out by a split-second timer.	3 Draw A future block's hash — not yet known when the round closed — picks the winning ticket. No oracle, no off-chain randomness.	4 Settle The pool splits automatically (see below) and the winning wallet is recorded, on-chain, as eligible to redeem.	5 Redeem The winner sends their own USTC and receives USDC 1:1, in one or several transactions, until the prize is used up.
---	---	--	---	---

Two safety nets, both self-service — nobody has to ask Repeg Club for anything: a round that never reaches its minimum player count simply expires, and anyone who bought in can reclaim their exact ticket cost. And any wallet can back out for a full refund at any point *before* the minimum is reached, no questions asked.

03 Don't trust — verify

The spinning wheel on screen is presentation, not the mechanism. The actual draw happens inside the smart contract, and every player's own browser can recompute it independently.

without asking Repeg Club’s servers, or Repeg Club’s word, for anything.

- 1

The block is real.

The exact block the draw used — its height and its real timestamp — is public chain data. Anyone can open its raw contents directly from the network.
- 2

The ticket list is real.

Every ticket bought that round, in order, is also public on-chain data with its own direct link — not something Repeg Club could quietly edit.
- 3

One fixed formula.

Round ID, block height, block time, and the full ticket list all feed one hash. The result always points to the same single ticket.

```
winner = SHA256( round_id, block.height, block.time, tickets[] )
```

Every drawn round has a "Verify this round" panel that runs all three steps live, in the visitor's own browser, and shows every input plus a one-click JSON export — enough for anyone technical, or any AI they paste it to, to redo the whole calculation from scratch.

04 Where the ticket money goes

Every ticket splits five ways the instant a round draws. No step is optional, no cut is discretionary.

The treasury and the admin fee are two different wallets on purpose. The treasury needs 2 of 3 signers to move anything at all — no single person, including the founder, can spend it alone. The admin key that exists elsewhere in the contracts (see Security, below) can only ever move funds *to* that same treasury, never anywhere else.

05 Two more games, one engine

Weekly Round

SHARED JACKPOT

One platform-wide round, not one per ticket tier. It starts every week already funded by the 20% every single Wheel of Repeg round contributes, and sells its own ticket with a price that climbs a little each day the week runs — buy early, pay less. Same close/draw/settle/redeem mechanism, same public verification.

Create Your Own Luck

FOR ANY CREATOR

The same contract engine, offered as a tool: anyone can spin up their own raffle — a single winner, or an equal airdrop to everyone who entered — funding whatever prize they want to offer. The platform's own cut is a flat USDC fee decided at creation, never a percentage of someone else's prize, and it's hardcoded rather than set by the raffle's creator, so nobody running a raffle can quietly redirect it. Every raffle gets the exact same public verification panel described above.

For a project manager or builder in the community, this doubles as a real fundraising tool: a genuinely compelling prize can pull in far more in ticket sales than the prize itself costs — funding real things, like liquidity, ongoing costs, or whatever the project actually needs, not just a giveaway. A growing cooldown already discourages any single wallet from running many small, low-effort raffles back to back. Next up: a public reputation system for creator wallets, so a track record of well-funded, well-run raffles is visible before anyone risks a ticket on a new one — protecting players and rewarding the creators actually worth backing.

A *paid* raffle's prize has to be LUNC, USTC, or USDC — never a token the creator picks, whose name and symbol can't be independently verified. Reputable, liquid CW20 tokens will be whitelisted later, after the same manual review the native assets already went through. Free-to-enter raffles are the exception already, today: an Airdrop can hand out any CW20 to up to 1,000 wallets, since nobody has to trust the token to enter for free. The creator still pays for that — a flat USDC fee that scales with how many wallets could receive a share (from \$3 up to 100 wallets, to \$18 up to 1,000), split the same 50/50 between the founder and the treasury as everywhere else on the platform. Claiming costs each recipient nothing be-

yond their own transaction gas — the contract flatly refuses any funds attached to a claim, so "pay a small fee to receive your airdrop" can never be a legitimate request here.

06 Security posture

This is a young, small project — worth saying plainly what's been done, and what deliberately hasn't yet.

✓ Independent AI review on every contract change

Two separate models (Opus and Fable) review each change blind, with no hints that other checks already passed, before anything ships — plus an extra pass from a third model, Nemotron 3 Ultra, that has caught real issues the other two hadn't flagged.

✓ Grinding window, not an open-ended retry

The draw can't be freely re-rolled by waiting for a favorable block — a bounded window caps how much of that is even possible.

✓ Clean static analysis

`cargo audit` and `clippy` pass clean across all three contracts.

✓ Public, auditable source

The full repository is open — every contract, every frontend line, every commit.

✓ Narrow, explicit admin key

It can only sweep long-unclaimed funds to the treasury after a long timeout — never redirect them anywhere else, and never touch an active round.

✓ Every pull request reviewed by CodeRabbit

An automated code-review bot checks every change before it merges — a separate, independent layer from the reviews above.

○ No professional external audit yet

Funded by the treasury once it holds enough to cover one — not a corner cut, a sequencing choice. Ongoing ticket sales are part of how that threshold gets reached responsibly.

07 Where things stand today

MAINNET

Wheel of Repeg, Weekly Round, and Create Your Own Luck are all **live on Terra Classic's real mainnet**, end to end — buy, close, draw, verify, redeem, all of it, real money, right now at **repegclub.com**. The public testing phase below is what got the mechanics to this point unchanged.

08 What comes next

Mainnet launch and the external audit were never sequential gates — the audit doesn't wait on a launch that's already happened.

DONE

Public testing

Weeks of real people, breaking things on testnet, before anything real was at stake.

DONE

Mainnet launch

Started deliberately small — one ticket tier, proven before the next is added, not a wall of "coming soon" tiers shown in advance.

NEXT

External audit

Paid for by the treasury once it holds enough to cover a proper professional review — independent of the mainnet launch date, informed by what the testing phase surfaced.

AFTER

More tiers, more games

Higher ticket tiers once the first is proven, and Create Your Own Luck opened up as a tool the wider Terra Classic community can build on.

09 What you can do right now

- **Play a round.** Connect Keplr, buy a ticket, watch it through to redemption — the whole loop, live on mainnet, with real money.

- **Check our work.** Open "Verify this round" on any drawn round and try to catch it lying. You won't need to trust us to do it.
- **Tell us what broke, or what confused you.** The Feedback button lives right on the site — that's exactly what this phase is for.

Read this part too. Repeg Club runs on Terra Classic's real mainnet today — this involves real money, and none of this is financial advice. USTC's market price is not affected by this product; a repeg only ever applies to the specific amount a round's winner is entitled to. No professional external security audit has been completed yet (see Security, above). Contracts and copy are still subject to change.
